                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AUTHORS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complete sequence against a peptide database and plant EST databases at TIGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats were identified by repeatmasker (Arian Smit,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complete sequence.

The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the capomictic plant. Apomixis provides for true-breeding, seed apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                              Production of apomictic seeds - useful in plant breeding Production of apomictic seeds - useful in plant breeding Claim 27; Pages 91-95; 123pp; English.

Cit has be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the transformed material into plants or carpel-containing
plant parts; and (c) expressing the sequence in the vicinity
of the embryo sac. The apomictic seeds and embryos thus produced
can be developed into plant progeny. This is useful in plant
breeding programs. Controllable and reproducible apomixis provides
many advantages in plant improvement and cultivar development in
the case that sexual plants are available as crosses with the
propagated hybrids and could shorten and simplify the breeding
propagated hybrids and could shorten and simplify the breeding
process so that selfing and progeny testing to produce and/or
stabilise a desirable gene combination could be eliminated.
Apomixis allows plant breeders to develop cultivars with
specific stable traits for such characteristics as height,
seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4094

CC The sequence is that encoding SERK, a putative receptor kinase. CC It may be used as part of a method of producing apomictic seeds CC comprising; (a) transforming plant material with a nucleotide cc sequence encoding a protein which in active form in a cell or CC cell membrane renders the cell embryogenic; (b) regenerating CC the transformed material into plants or carpel-containing CC plant parts; and (c) expressing the sequence in the vicinity CC of the embryo sac. The apomictic seeds and embryos thus produced CC can be developed into plant progeny. This is useful in plant CC the case that sexual plants are available as crosses with the CC many advantages in plant improvement and cultivar development in CC the case that sexual plants are available as crosses with the CC apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding corporates so that selfing and progeny testing to produce and/or CC stabilise a desirable gene combination could be eliminated. CC Apomixis allows plant breeders to develop cultivars with CC seed and forage quality and maturity.

DNA encoding plant morphogenesis regulatory protein - useful tyleld plants with short stems or altered inflorescence I yield plants with short stems or altered inflorescence I yield plants with short stems or altered inflorescence I yield plants with short stems or altered inflorescence. The present sequence encodes an Arabidopsis thaliana plant comphogenesis regulatory protein (MRP), which can be used to I a plant with, e.g. short stems or altered inflorescence. The I cats on a plant at a specific site for a specific period, and I cats on a plant at a specific site for a specific period, and I cats on a plant at a specific site for a specific period, and I cats on a plant at a specific site for a specific period, and I cats on a plant at a specific site for a specific period, and I cats on a plant at a specific site for a specific period, and I cats on a plant to increase its MRP expression, and therefore control the plant to increase its MRP expression, and therefore control the sequence 3176 BP; 927 A; 654 C; 659 G; 936 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1128

The MRF acts on a plant at a specific site for a specific period, and cat therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant. New receptor kinase Binl involved in brassinolide signalling - useful for promoting increased yield and disease resistance in plants and for modulating occyte maturation Claim 8; Page 49-52; 72pp; English.
This DNA sequence codes for a novel plant steroid receptor kinase, designated Binl (see W97819), which is involved in the pathway for the synthesis of the plant steroid hormone, brassinolide. 18 New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to respond to brassimolide, and were named bin mutants. The binic mutations were used to map the gene to a small interval on Arabidopsis chromosome 4. Bini was cloned by map-based cloning. The Bini polynucleotide was identified within this interval by generally the wild-type and mutant alleles of this nucleic acid. Overexpression of Bini in transgenic plants over the plants of characterised as having enhanced disease resistance, increased plants of plant yield or vegetative biomass and increased seed yield. Expression of Bini may also increase resistance to pesticides. CC inhibition of Bini, e.g. using antisense oligonucleotides (AON), is cused to render plants male-sterile, and to reduce their stature or yield, e.g. for creating dwarf varieties. Since Bini homologues can be involved in regulation of the menstrual cycle and uterine compared to proving success of in vitro fertilisation and to prevent premature labour. Transgenic animals are also provided, and are models for studying steroid-receptor interactions or can be used to screen for therapeutic agents.

Such genes from cassava, maize and tomato are also described. The genes and proteins cabe used for enhancing resistance to Xanthomonas in a plant, preferably rice or tomato.

In this invention an apoptosis resistant 293 cell line (having apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-ires-bsr, which contains the cowpox virus bsr gene, and is used in an example from the present invention.

Combined the present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced. CC The recombinant viruses generated are capable of expressing apoptosis-sasociated genes. These can then be used in a variety of diseases for cc which the induction of apoptosis by gene transfer, or where the induction of apoptosis by gene transfer, or where the cancer cc therapy for destroying cancer cells selectively. The treatment of cautoimmune diseases and graft rejection reaction, and apoptosis induction ct therapy for inflammatory cells in inflammatory diseases. Prior arts have cencountered the problem where if an adenovirus vector capable of cxpressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of ct the required to induce cell death by apoptosis is shorter than that combined to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the cromation areample from the present the human Bcl-xl gene, and cc plasmid pRx-Bcl-xl-bsr, which contains the human Bcl-xl gene, and cc sequence 7372 BP; 2353 A; 1749 C; 1649 G; 1621 T;

                                                                                                                β
                                                                                                                                                                                                                                               PT New applosis-resistant virus-sensitive cell
PS Example 1; Page 34-38; 51pp; English.

CC The present invention describes an apoptosis-resistant virus-sensitive
CC cell line into which an apoptosis resistance gene has been introduced.

CC The recombinant viruses generated are capable of expressing apoptosis-
CC associated genes. These can then be used in a variety of diseases for
CC which the induction of apoptosis by gene transfer, or where the
CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses
CC are useful as vectors for gene therapy which can be applied to cancer
CC therapy for destroying cancer cells selectively, the treatment of
CC autoimmune diseases and graft rejection reaction, and apoptosis induction
CC therapy for inflammatory cells in inflammatory diseases. Prior arts have
CC expressing an apoptosis-associated gene is introduced into animal cells,
CC expressing an apoptosis-associated gene is introduced into animal cells,
CC time required to induce cell death by apoptosis is shorter than that
CC required to replicate and produce the virus, resulting in failure to
CC obtain a recombinant virus having the integrated apoptosis-associated
CC apoptosis resistant gene introduced) is established and overcomes the
CC apoptosis resistant gene introduced) is established and overcomes the
CC problem. The present sequence represent invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δÃ
                                                                                                                                  Provided the problem where if an adenovirus vector capable of expressing an apoptosis resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced. The present invention describes an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis associated genes. These can then be used in a variety of diseases for conhibition of harmful apoptosis by gene transfer, or where the cinhibition of harmful apoptosis, is therapeutic. The recombinant viruses care useful as vectors for gene therapy which can be applied to cancer through for destroying cancer cells selectively, the treatment of care useful as vectors for gene therapy which can be applied to cancer therapy for inflammatory cells in inflammatory diseases. Prior arts have cencountered the problem where if an adenovirus vector capable of capacities producing the virus will be destroyed because the period of the cells producing the virus will be destroyed because the period of contain a recombinant virus having the integrated apoptosis associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant yene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the cell sused in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5583
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1209
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5643
This invention describes a method for conferring disease resistance in plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and proteins can be used for enhancing resistance to Xanthomonas in a plant, preferably in
                                                              New RRK polynucleotides and nucleic acid constructs - generating transgenic plants resistant to Xanthomonas Claim 14; Page 61-62; 67pp; English.
This invention describes a method for conferring disearch
